
(a) One seed trace, m/z 496.3414
intensity (dashed, log)
± 2 σ(I) of the fitted model
m/z of the ion per scan (ppm from its mean)
m/z deviation (ppm)
RT (min)
(b) All 44,333 centroids of the seed traces
file floor 3,896:
σ = 1.34 ppm
→ tolerance cap 4 σ = 5.4 ppm
σ(I) = √(a² + b²/I)
a = 0.30 ppm, b = 82
orange: robust sd per
half-decade bin (≥ 20 pts)
m/z deviation from the ion's mean (ppm)
centroid intensity
(c) The linking tolerance that follows
4 σ(I) for a pair of equal intensity
cap 5.4 ppm (4 σ at the floor)
floor 5 ppm
two centroids in adjacent scans
may be the same ion when their m/z
distance is within the shaded band
m/z tolerance (ppm)
intensity
