What does the 3D in Peak3D mean?

An intensity landscape over retention time and m/z, represented by connected centroids.

A and C: same m/z, different RT. B: a co-eluting ion at a different m/z.

The same graph, viewed from above

Position: retention time + m/z

Links use nearby scans and pair-specific mass tolerance.

Height: effective intensity

Same-scan split pieces contribute to the local height.

Colour: centroids assigned to the same surviving apex.

Time and m/z define local neighbours; intensity directs their paths toward apexes.

Synthetic centroid graph • actual Peak3D links and basin labels • no fitted surface or voxel grid
